The UML has proven its ability to document and model the systems on a large, medium, and small scale.

The revolutionary effects of using accounting information systems by displacing manual information systems in the private and public sectors cannot be overstated. The benefits of this substitution of set of processes include increased mathematical accuracy, predefined fields and coding tasks, and de-emphasis of manual clerical labor in favor of labor adept in data processing. Reporting can be significantly automated, facilitating managerial power and control at a distance and the proliferation of global enterprises. The potential detriments are rarely accurately, completely, and timely addressed as information system vendors, management consultants, and corporate procurement teams race toward the popularly conceived state of the art. Systems are ballyhooed as continually improving in processing speed, functionality, and capacity. Users of these automated systems may not consider big picture effects, and they may not intelligently consider the conduct risks to their own enterprises by concentrating such global reach and influence at high levels of senior management without dedicating adequate resources to verifying the accuracy, completeness, and timeliness of the information systems. This book considers these risks.

In Audit Effectiveness, Dr Kamil Omoteso examines how information technology is changing the landscape for the audit profession as IT tools and techniques continue to be developed for auditors in the pursuit of quality, efficiency and effectiveness. In addition to shedding light on practical subjects such as audit automation, continuous online auditing and computer auditing, this book introduces some theory that helps explain the motivation for the use of new tools and techniques, and assists understanding of their impact on the quality of audit judgment. The book proposes a three-layered model - an integration of contingency, socio-technical systems and structuration theories - for a comprehensive understanding of IT's impact on audit. The model advocates that the use of IT in audits is a function of certain contingent factors that determine an optimal mix of human skills and technological capabilities, which would lead to changes in the nature of auditors' roles and outputs and audit organisations' structures. Dr Omoteso puts forward an audit automation maturity model that can help audit firms/departments to understand their current level of IT integration and how to systematically enhance their capabilities with a view to meeting modern IT challenges - taking them from the position of mere 'followers of technology' to that of effective 'leaders of technology'. Audit Effectiveness is for anyone practising in auditing or accounting automation, as well as for those with an academic or research interest in the challenges posed by technological advances for auditors in particular, and for managers in general.
