

# Lagooned

Viruses and Wastewater Treatment covers the proceedings of the International Symposium on Viruses and Wastewater Treatment. The book presents studies that deal primarily with the virological aspect of water sanitation. The topics covered in the selection include methods for studying virus in waste waters, such as virus recovery from wastewater using microfiberglass filters and rapid detection of enteroviruses in water by a quantitative fluorescent antibody technique. The text also covers topics about post-treatment of waste waters, which includes fate of viruses following land application of sewage sludge and virus survival in wastewater treated soils. The book will be of great use to individuals involved in the research, development, and implementation of water treatment technology.

In the decades, ahead, as virus detection technology continues to improve, we may expect greater attention to the problem of water transmission of these agents. This books' contributors will discuss the developing knowledge and technology for the detection and measurement of viruses in waters and wastewaters in dealing with the problem presented by that presence.

Sugar Series, Vol. 2: Manufacture and Refining of Raw Cane Sugar focuses on the processes, methodologies, principles, and approaches involved in the manufacture and refining of raw cane sugar. The selection first offers information on sugar cane, harvesting and transportation to the factory, washing, disposal of wash-water and cleaning the juices, and extraction of juice. Discussions focus on disposal of bagasse, screw presses, cane carriers,

juice cleaning, waste-water disposal, washing, cane weighing in field and factory, transportation, and sugar-producing plants. The manuscript then examines the sugar cane diffusion process, weighing, clarification, and liming of cane juice, filtration of mud from clarifiers, evaporation, and vacuum pans. The book ponders on boiling of raw sugar massecuites, crystallization by cooling and motion of low-grade massecuites and the exhaustion of final molasses, centrifugals and purging of massecuites, storing and shipping bulk sugar, and final molasses. The selection is a valuable source of data for researchers wanting to study the manufacture and refining of raw cane sugar. Starting with sludge and scum characterization, this practical guide provides least cost methods of improving sludge quality, options for beneficial reuse, the costs of implementing those options, and case studies of sludge reuse programs around the country. From the pitfalls of site selection to pairing sludge products with their markets, this is a comprehensive resource for anyone working to establish a successful sludge reuse program. Each sludge processing option is presented in depth, including costs, operational difficulties, odor control, and application of the sludge product. The land application of liquid sludge, traditional and innovative methods of natural and mechanical dewatering, and lime stabilization processes are covered in detail.

Composting options including aerated static pile composting, vermicomposting, windrow composting, and in-vessel composting are investigated. Sludge pelletizing processes and innovative technologies for sludge reuse are discussed, along with the Part 503 regulations.

Originally published in 1965, this case study of the beet sugar industry undertaken by George O. G. Lof and Allen V. Kneese illustrates the economic importance of water to industry. This study delves into the history and technology of the beet sugar industry to demonstrate the economic impact of the water environment and how water waste can be reduced in other industries. This title will be of interest to students of environmental studies.
