This collection brings together some of the most influential sociologists of law to confront the challenges of current transnational constitutionalism. It shows the constitution appearing in a new light: no longer as an essential factor of unity and stabilisation but as a potential defence of pluralism and innovation. The first part of the book is devoted to the analysis of the concept of constitution, highlighting the elements that can contribute from a socio-legal perspective, to clarifying the principle meanings attributed to the constitution. The study goes on to analyse some concrete aspects of the functioning of constitutions in contemporary society. In applying Luhmann's General Systems Theory to a comparative analysis of the concept of constitution, the work contributes to a better understanding of this traditional concept in both its institutionalised and functional aspects. Defining the constitution's contents and functions both at the conceptual level and by taking empirical issues of particular comparative interest into account, this study will be of importance to scholars and students of sociology of law, sociology of politics and comparative public law.

The Betrayal of the Body is Alexander Lowen's pioneering study of the mind-body split. Lowen describes the way people deny the reality, needs, and feelings of their bodies. This denial leads to the development of the division between mind and body, creating an over-charged ego obsessed with thinking at the expense of feeling and being. This book illustrates the energetic factors behind the split, the factors that produce it, and the proven therapeutic techniques that are available to treat it. Lowen further explores the mind-body duality in the individual and its parallel duality and dysfunction in society between culture and nature, and between thinking and feeling.

This new Manual builds on the success of the first edition of the BSAVA Manual of Small Animal Ophthalmology. This new edition begins with a clear and concise guide to the examination of the eye. Using the techniques described and the lists of differential diagnoses provided in Appendix I, it should be possible for ocular lesions to be identified and localized with precision. Chapters on imaging techniques (radiography, ultrasonography, CT and MRI) and laboratory investigations follow. New to this edition are chapters on anaesthesia and surgery. Basic principles such as tissue separation and suturing are described and illustrated with specially commissioned drawings. Ocular conditions of dogs and cats are covered in chapters on specific regions, progressing from the adnexa (orbit and periorbital regions, eyelids and lacrimal system) to the eye itself, and thence to the

connections between the eye and the brain. Each chapter starts with a short section that considers the relevant anatomy and physiology of that portion of the eye. Following a consideration of diagnostic tests, clinical features are described and illustrated by a wealth of high-quality full-colour images. Medical and surgical management are then discussed for each condition. Conditions of the dog and cat are mostly considered separately, except where there are close similarities. The last two chapters of the Manual briefly describe ocular conditions of rabbits and exotic species (primates, rodents, birds, reptiles and fish), with emphasis on the commoner disorders and those that differ markedly from the conditions already described for the dog and cat. The Manual is a practical consulting room guide to small animal ophthalmology, but there is sufficient detail to satisfy those who wish to study this fascinating specialty in greater depth. From the very early days human beings depend on animals and animal products for food and other requirements. In dairy and poultry farms high yielding animals are reared. These high yielding animals are produced by hybridization experiments. Previously the animals were developed basing on unscientific methods. Before the discovery of principles of heredity human beings have selected the animals with required characters and learned to develop the plants having the selected characters. This phenomenon is called Artificial selection. However, an increased knowledge of biology, especially genetics, has helped in improving the quality of animals and animal products as per the human requirements. The revolution in genetic mapping technology and the advent of whole genome sequences have turned quantitative genetics into one of the fastest growing areas of biology. The animal breeding and genetics provide new scientific discoveries to age-old livestock production problems to help producers and consumers. Animal breeding addresses the evaluation of the genetic value of livestock. Selecting for breeding animals with superior EBV in growth rate, egg, meat, milk, or wool production, or with other desirable traits has revolutionized livestock production throughout the world. The scientific theory of animal breeding incorporates population genetics, quantitative genetics, statistics, and recently molecular genomics. The book *animal breeding and genetics* encompasses topics such as genetic variability, genetic testing, and animal breeding focuses on various aspects of animal heredity, or the passing of traits from one generation to the next. It is of valuable tool for students, researchers, professors and a variety of employers, including government agencies, zoos, and food producers.

Recent research has begun to highlight the importance of German arguments about legitimate resistance and self-defence for French, English and Scottish Protestants. This book systematically studies the reception of German thought in England, arguing that it played a much greater role than has hitherto been acknowledged. Both the Marian exiles, and others concerned with the fate of continental Protestantism, eagerly read what German reformers had to say about the possibility of resisting the religious policies of a monarch without compromising the institution of monarchy itself. However, the transfer of German arguments to England, with its individual political and constitutional environment, necessarily involved the subtle transformation of these arguments into forms compatible with local traditions. In this way, German arguments contributed significantly to the emergence of new theories, emphasising natural rights.
